

Instructions for Growbags:

1. Remove growbag from the packing and place it on the flat surface where you plan to grow on.
2. If using more than one bag, always leave a gap at the end of each one for the bag to expand length ways.
3. Do not place directly onto soil as the roots will go through the drainage holes; place on a hard surface or cover the ground with plastic first.
4. Connect a pipe to a tap or use a watering can to expand the growbag slowly until the medium is completely wet and the bag has expanded to full size.
5. You must have drainage of 50% before transplanting seedlings. You can also sow the seeds directly into the planter holes provided.
6. Please use liquid nutrients such as N, P, K and micronutrients to attain more growth and yield.
7. For irrigation, a drip line is advised as it will help you obtain multiple irrigations in a day.
8. Check the drainage regularly to avoid increases of electroconductivity levels in growbags
